End Of Unit Test
E2E Testing or end-to-end testing, is the practice of testing if the execution of an application is performing as designed from start to finish. The entire application is tested in real-world scenarios, which includes testing the communication between components such as the database, network, APIs etc. and executing your code in a diversity of browsers.

Introduction to Front-End unit testing - DEV Community
Unit Testing. As we discussed in part one, unit testing is code that tests units of code, whether they be functions, modules, or classes. Most people believe that the bulk of the testing should be unit testing, but I don't, but it's OK if you do — as I will stress again and again during these blog posts, it doesn't really matter how you do your tests, as long as you write enough tests that make you feel confident that you can deploy your version to deployment.

And, finally, unit tests don't exercise multiple components of your system and how they act. If you have a console application and you pipe input to it from the command line and test for output, you're executing an end-to-end system test — not a unit test. Make no mistake — tests that do these things add value.

While the test is running, the status bar at the top of the Test Explorer window is animated. At the end of the test run, the bar turns green if all the test methods pass, or red if any of the tests fail. In this case, the test fails. Select the method in Test Explorer to view the details at the bottom of the window. Fix your code and rerun your tests

C# unit test tutorial - Visual Studio | Microsoft Docs
Unit testing is a testing method by which individual units of source code are tested to determine if they are ready to use, whereas Integration testing checks integration between software modules. Unit Testing test each part of the program and shows that the individual parts are correct, whereas Integration Testing combines different modules in the application and test as a group to see they are working fine.

Unit Test vs Integration Test: What's the Difference?
End-to-end tests are very useful, but they're expensive to perform and can be hard to maintain when they're automated. It is recommended to have a few key end-to-end tests and rely more on lower level types of testing (unit and integration tests) to be able to quickly identify breaking changes.
