TPE is a non-standard Bayesian optimization algorithm. While SPEARMINT and SMAC model  $p(f_j)$  directly, TPE models  $p(f < f)$ ,  $p(f_j < f)$ , and  $p(f_j < f_j)$ , where  $f_i$  is defined as a fixed quantile of the losses observed so far, and the latter two probabilities are defined by tree-structured Parzen density estimators.

Hyperparameter Optimization. The aim of hyperparameter optimization in machine learning is to find the hyperparameters of a given machine learning algorithm that return the best performance as measured on a validation set. (Hyperparameters, in contrast to model parameters, are set by the machine learning engineer before training.
